FEATURES

- Units are **UL_{US}** Listed.
- Designed for use with R22, R404A and R507.
- Energy efficient compressors with POE or Mineral oil. Several Options to choose from: Copeland Discus, Bitzer reciprocating, Carlyle reciprocating, Copeland Screw.
- Single, Dual and parallel-piped(optional) compressor configurations available.
- Thermospan™ condenser core design eliminates tube sheet leaks and provides reliable operation.
- 3/8" condenser tubes reduces refrigerant charge.
- Generously sized condenser allows unit to operate at higher than normal ambient conditions.
- Optional coating and fin surfaces for condenser core protection available.
- Specially designed, thermally protected and permanently lubricated ball bearing condenser fan motor(s).
- Receivers (where used) are liberally sized and include inlet as well as outlet service valves.
- Subcooling circuit in condenser on all models (except air conditioning and H2 models) increases overall system efficiency and provides dependable compressor operation.
- Utilizes pre-formed internal piping, eliminates welded joints and reduces chances of a leak.
- Electrical components are housed in a spacious and conveniently located panel. In case of a compressor trip, (except on air conditioning models) a Lock-out relay de-energizes the liquid line solenoid valve. In addition, SPDT contact is provided for field wired alarm circuit.
- End compartment panels allow unrestricted access to service the compressor(s) and all other components.
- Raceway for pressure control wiring and connections provides neat appearance.
- Units are available with energy efficient Thermosaver™ hot gas defrost option.
- Units are environmentally friendly operating on less power and refrigerant charge.

CAPACITY RATINGS AND SELECTION

RATING INFORMATION:

1. Ratings as shown are at saturated suction temperatures.
2. 60Hz capacity ratings are shown in imperial and metric units: **MBH** in bold type, (*KW*) in italics with in brackets.
3. Ratings may be interpolated but should not be extrapolated.

SELECTION PROCEDURE: Determine following requirements:

1. Ambient temperature, - °F / °C.
2. Total cooling load - **MBH** / (*KW*).
3. SST (saturated suction temperature) - °F / °C.
4. Refrigerant type - R22/R404A/R507.

EXAMPLE SELECTION:

GIVEN:

- Ambient temperature, **95°F** / 35°C.
- Total cooling load **115MBH**.
- SST, - **20°F** / -28.8°C.
- Refrigerant, R404A.

METHOD:

- Go to the R404A low temperature capacity chart.
- Determine the capacity rating under **95°F** ambient column and **-20°F** SST row.
- Select the model with closest capacity requirement which is BVS030L6 with capacity **115.2 MBH**.

SELECTION OF TWO-COMPRESSOR UNITS

BVD condensing units are double compressor units. The ratings shown are the total capacity of two compressors operating simultaneously. Standard BVD models are designed with two

independently operating systems, each with a separate refrigeration circuit. Optional parallel piped compressors (one total system) are available. Consult factory.

LOW AMBIENT OPERATION

FAN CYCLING CONTROL

BV condensing units are furnished with fan cycling pressure control as standard on 2 fan models and up. This enables start and operation in low ambient air temperature. Fans are cycled by pressure controls.

Four and six-fan, two compressor models are controlled the same as two or three-fan models (single compressor, single row condenser). See diagram below. Standard fan cycling head pressure control is based on one fan operating at constant speed.

FAN CYCLING CONTROL SCHEDULE

| CIRCUITING | SINGLE COMPRESSOR | | DUAL COMPRESSOR | |
|-------------------------------------|---|---|---|---|
| FAN ARRANGEMENT |  |  | *  | *  |
| FAN(S) CYCLED |  |  |  |  |
| FAN(S) IN CONSTANT OPERATION |  |  |  |  |

* Systems operate individually on double compressor units.

LIMITROL HEAD PRESSURE CONTROL**

Limitrol 2 valve pressure adjustable (factory adjusted) head pressure control is a standard feature in BV condensing units. The Limitrol valve is pressure actuated and will modulate the flow of liquid refrigerant from the condenser to the receiver and thus flood the condenser coil surface. This reduces the effective condensing surface at low ambient and/or partial loading, thus maintaining a minimum condensing pressure.

Operation

During periods of low ambient temperature, the condensing pressure falls until it approaches the setting of the limitrol valve. The valve throttles restricting flow of liquid from the condenser. This causes refrigerant to back up in the condenser thus reducing condenser surface, and raising condensing pressure.

During this period the differential pressure regulating valve modulates open, allowing hot discharge gas to maintain a minimum receiver pressure. The Limitrol valve pressure setting is pre-set at factory and can be further adjusted to suit local conditions during start-up.

Refrigerant Charge

Because liquid refrigerant is being utilized for the purpose of flooding the condenser, the refrigeration system must be designed so that the condenser can be filled with liquid refrigerant and the receiver still retain a liquid seal. An additional amount of refrigerant is therefore required for the Limitrol system to operate at lower ambient over that required for summer operation. The installation manual shows the unit refrigerant charge for both normal and winter time applications.

^=Compressors operating on R404A to have Y at the end (indicates POE oil in compressor)

Receiver holding capacities indicated are for R22 in H/M{high and medium temp.}models; and R404A in L (Low temp.)

and V(Extended Low temp.)models. Standard airconditioning models do not have receivers. Consult factory for selection and pricing, if receivers are required on a/c models.

Connection sizes and receiver capacities are for each refrigeration circuit.
